Description of data

- Approximately 3000 pigs, each with 20 depth-images captured by a Kinect sensor, and a corresponding muscle score given by an expert assessor.
- Objective: predicting the muscle score using the images only.

Guess the muscle score (7 and 1)

Image selection

Selection is based on multiple criteria, including posture uniformity, which we measured by a symmetry index.

Supervised learning with tree ensembles

- Ability to model nonlinear interactions.
- Ability to handle heterogeneous modalities of data with minimal pre-processing.
- Good performance with fewer user-specified parameters.

Classification results

Conclusions

- Limitations of learning from subjective data.
- Future improvements with better data.
- Practical implication.
